#### Abstract

Paper presents analysis of flat slab with drop panel subjected to realistic concentrated loadings - trapezoidal load, line load and patch load. Finite element analysis in software SAFE of rectangular flat slab panels under gravity loads is carried out for the different panel aspect ratio $1,1.5$ and 2. For different panel aspect ratio Positive and Negative moments of column strip and middle strips as well as Punching shear values at critical sections under trapezoidal load, line load and patch load are compared with that under Equivalent Uniformly distributed loads.

Keywords - Flat Slab, Finite element analysis, Line load, Panel aspect ratio, Patch load, Trapezoidal Load, Surface loads, Punching Shear

## I. Introduction

Flat slabs are highly preferred floor system for large column free areas. Also includes advantages of economy and reduced storey heights. Exact analysis of flat slab is complex and design given by various codes is based on empirical formula and limited to uniformly distributed load only. Therefore finite element analysis is done to carry out to precise analysis under other realistic loading. Flat slab is analysed in SAFE software for panel aspect ratio $1,1.5$ and 2.

## II. METHODOLOGY

Flat slab is analysed in software SAFE (Slab Analysis by Finite Element Method) area divided into $5 \times 5$ panel system subjected to various gravity load i.e. surface load, trapezoidal load, line load, patch load. Moments of column strip and middle strip are compared with equivalent uniformly distributed load. There are following load cases enlarged.

1. Panels subjected to line load acting along centre lines of the panel on $0.1 \mathrm{~L}_{\mathrm{x}}$ and $0.1 \mathrm{~L}_{\mathrm{y}}$ wide strips.
2. Panels subjected to central patch load size $0.1 \mathrm{~L}_{\mathrm{x}}$ and $0.1 \mathrm{~L}_{\mathrm{y}}$.
3. Trapezoidal load.

In this analysis quadrilateral shell element is used. Results are compared with the same total load acting as uniformly distributed load for the aspect ratio $1,1.5,2$.

## DATA-

Panel Size- vary as per aspect ratio
Column Size- 500 mmx 500 mm
Drop Panel- 3 mx 3 m

Dead Load- $2.7 \mathrm{KN} / \mathrm{m}^{2}$
Live Load- $2.5 \mathrm{KN} / \mathrm{m}^{2}$
Grade Used- M20 \& Fe 415

### 2.1 Calculation of Loads Equivalent to Uniformly Distributed Load-

### 2.1.1 Calculation of Uniformly Distributed Load-

Self weight of slab @ $25 * 0.2=5.0 \mathrm{KN} / \mathrm{m}^{2}$
I. Dead load $=2.7 \mathrm{KN} / \mathrm{m}^{2}$
II. Live load $=2.5 \mathrm{KN} / \mathrm{m}^{2}$ Total load $\quad=10.2 \mathrm{KN} / \mathrm{m}^{2}$

Factored load on slab $\mathrm{W}_{\mathrm{u}}=10.2 * 1.5=15.3 \mathrm{KN} / \mathrm{m}^{2}$
Where $\mathrm{W}_{\mathrm{u}}=$ Total load on slab

### 2.1.2 Calculation of Trapezoidal Load-

Trapezoidal load is applied on the all the panels of the flat slab on the whole panel area.
$\mathrm{W}_{\mathrm{u}}=$ Total surface load on flat slab $=15.3 \mathrm{KN} / \mathrm{m}^{2}$
Total trapezoidal load on flat slab $=\left(\mathrm{W}_{\mathrm{u}} * \mathrm{~L} * \mathrm{~B} * 3\right) /(\mathrm{B} * \mathrm{~L})$

$$
=46 \mathrm{KN} / \mathrm{m}^{2}
$$

$$
=(15.3 * \mathrm{~L} * \mathrm{~B}) /(\mathrm{B} * 0.1 \mathrm{~L})
$$

### 2.1.3 Calculation of Line Load-

Total line load on flat slab $=\left(\mathrm{W}_{\mathrm{u}} * \mathrm{~L} * \mathrm{~B}\right) /(\mathrm{B} * 0.1 \mathrm{~L})$

$$
\begin{aligned}
& =(15.3 * \mathrm{~L} * \mathrm{~B}) /(\mathrm{B} * 0.1 \mathrm{~L}) \\
= & 153 \mathrm{KN} / \mathrm{m}
\end{aligned}
$$

### 2.1.4 Calculation of Patch Load-

Total line load on flat slab $=\left(\mathrm{W}_{\mathrm{u}} * \mathrm{~L} * \mathrm{~B}\right) /(0.1 \mathrm{~B} * 0.1 \mathrm{~L})$

$$
\begin{aligned}
& =(15.3 * \mathrm{~L} * \mathrm{~B}) /(0.1 \mathrm{~B} * 0.1 \mathrm{~L}) \\
= & 1530 \mathrm{KN} / \mathrm{m}^{2}
\end{aligned}
$$

## III. RESULT

3.1 Comparison of Column Strip Moment for Aspect Ratio 1, 1.5, 2 for each load case-

Fig 3.1: Comparison of Column Strip Moment for Each Load Case for $\mathrm{Lx} / \mathrm{Ly}=1,1.5,2$
3.2 Punching Shear Force for Aspect Ratio 1, 1.5, 2 for each load case

Fig 3.2: Comparison of Punching Shear Force for Each Load Case for Lx/Ly=1, 1.5, 2 3.3 Comparison of Width of Column Strip for Aspect Ratio 1, 1.5, 2 for each load case-

| Width of Column Strip (mm) |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Panel | UDL | TRAPEZOIDAL LOAD | LINE LOAD | PATCH LOAD |
| A1-F1 | 2000 | 2050 | 2250 | 2300 |
| A2-F2 | 4000 | 4100 | 4500 | 4600 |
| A3-F3 | 4000 | 4100 | 4500 | 4600 |
| A4-F4 | 4000 | 4100 | 4500 | 4600 |
| A5-F5 | 4000 | 4100 | 4500 | 4600 |
| A6-F6 | 2000 | 2050 | 2250 | 2400 |

Table 3.1: Width of Column Strip Comparison for Each Load Case $\left(L_{x} / L_{y}=1\right)$ Width of Column Strip (mm)

| Panel | UDL | TRAPEZOIDAL LOAD | LINE LOAD | PATCH LOAD |
| :---: | :---: | :---: | :---: | :---: |
| A1-F1 | 2050 | 2100 | 2300 | 2350 |
| A2-F2 | 4100 | 4200 | 4600 | 4700 |
| A3-F3 | 4100 | 4200 | 4600 | 4700 |
| A4-F4 | 4100 | 4200 | 4600 | 4700 |
| A5-F5 | 4100 | 4200 | 4600 | 4700 |
| A6-F6 | 2050 | 2100 | 2300 | 2350 |

Table 3.2: Width of Column Strip Comparison for Each Load Case $\left(L_{x} / L_{v}=1.5\right)$

| Width of Column Strip (mm) |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Panel | UDL | TRAPEZOIDAL LOAD | LINE LOAD | PATCH LOAD |
| A1-F1 | 2100 | 2150 | 2350 | 2450 |
| A2-F2 | 4200 | 4300 | 4700 | 4900 |
| A3-F3 | 4200 | 4300 | 4700 | 4900 |
| A4-F4 | 4200 | 4300 | 4700 | 4900 |
| A5-F5 | 4200 | 4300 | 4700 | 4900 |
| A6-F6 | 2100 | 2150 | 2350 | 2450 |

Table 3.3: Width of Column Strip Comparison for Each Load Case ( $\mathrm{L}_{\mathrm{x}} / \mathrm{L}_{\mathrm{y}}=2$ )

## IV. CONCLUSION

- Difference between column strip moment between uniformly distributed load and trapezoidal load is almost more than $50 \%$ which goes almost $250 \%$ higher ( 2.5 times) and 5.5 times in case of line load and patch load respectively.
- Thus it can be derived from above study that analysis of flat slab under realistic loading like trapezoidal load, line load, and patch load one cannot relay on codal method but Finite element analysis must to be adopted.
- As the aspect ratio changes from 1 to 2 middle strip moment is increasing $130 \%$ for aspect ratio 1.5 (1.3 times) and $165 \%$ for aspect ratio 2 ( 1.6 times) with respect to aspect ratio 1 .
- Difference between width of column strip and middle strip for the uniformly distributed load and trapezoidal load is varying less but for line load and patch load is varying very large as the aspect ratio increases.
- Difference between punching shear force between uniformly distributed load and trapezoidal load is almost $130 \%$ higher and for line load and patch load it goes $150 \%$ and $170 \%$ respectively.
