Abstract - The Smart Technology Library is a type of new cutting-edge library that works with a combination of cutting-edge technology, smart users, and advanced services. The smart library is introduced to explore new technologies in the area of smart library. A research project has been launched on the Science Scopus website to find out the number of publications published in the smart library and in its various departments. Smart libraries have two characteristics that offer a balanced picture of development and a specific understanding of public and academic libraries in urban and scientific centres. It can also contribute to a new vision of the libraries of the future, help define policies and strategies to get there, and help market and protect libraries for their comparison and intelligent library development. It helps to differentiate between the four. A good size for a smart, smart, good and well-led place. Smart libraries use modern technology to improve services for today's customers. The goal of a smart library is not a proprietary or operating system, but a linear, unstructured, creative, and modern goal.

INTRODUCTION

The emergence of technology in the 21st century will also benefit business, industry, government educational institutions and libraries. Libraries have improved facilities and services by being seamless. Changing the way one or more activities is carried out affects your organization's results and goals. This is a relevant challenge for any organization. Libraries as a storage place for information and resources need to be in line with current technological advances. Implementing digital library resources is a modern thing that libraries should consider, as users may want to access them directly. With tools in use today, such as smartphones and tablets, you can access more information anytime, anywhere. The development of communication technology is a challenge for many libraries. Today, many organizations operate and operate based on the use of IT devices such as computers, the Internet, and Wi-Fi connections. Same source and news. In Voting Augmentation (2003), many libraries have published works on input and output data. Input data: income/expenditure, collection size, staff numbers, study places and user space.

Output data: Circulations, reference transactions, inter library loan/document delivery, user training and attendance at events. This century, advertising and marketing have played a key role in providing solutions that meet consumer needs. Foreign companies such as email, email and publications are used to maximize the benefits of membership (Madden, 2008). The use of social media and websites helps the user's library. You can share new information with your users.

THE 21ST CENTURY LIBRARY

Advancing Technology

When a busy technology is discussed in the library library, there are many new things that can provide employee and development services. The library begins to use new things to provide information and education for the user. For example, after many years, the library website may not be very attractive to users. However, now I can connect to the source engine speed to the website and I feel much larger. Users are easily browsed with more users. Other technologies like RFID, automatic payment system payments and online information are one of the most important questions. E-Book's new style is a service record at the airport. Amaralur Courur Coururur Break Announcement releases the decision. This civilization is engaged in business by using Bluetooth signal that works with microtechnology technology. This is mentioned in the application of passenger application for passenger seats, so you can enter the library of e-books of special questions.

DIGITIZATION

Libraries store a lot of information and knowledge in a collection of items. As you know there are many collections in the library. You need a lot of space. Since the early 2000s, most libraries have started implementing digitization projects. Scanning or scanning is the process of converting physical document, such as voice, paper, or picture, into an electronic digital format that can be read by a computer on an electronic device. The information will be available online. One of the main goals of this initiative is to store the collection in the library. In this way, the library implements additional services for its users.

NEW MEDIA / WEB 2.0

The development of social media or Web 2.0 applications in the digital age adds value to any organization, including libraries, and creates intimacy between libraries and users. Social media can be described as a communication tool that allows other users to address problems directly. Applications like Facebook, blog, Twitter, flicker, and Insta gram are the most popular among users today. This application is a communication tool through the library to convey information to users. For example, you can view them using your smart phone or tablet. When libraries use social media, they focus more on numbers. The capacity of the library is increasing. This means that most users are aware of library notices and library users can contact library staff directly on published topics.

Reading data formatted

Data literacy can be defined as the process by which a person acquires, evaluates, manages, and uses data from multiple sources. The source can come from a collection of physical libraries, CD ROMs, databases, or the Internet. The library operates seven data reading programs designed to educate users and use the library collection. Reading facilities and equipment: - The status of the library is not only to provide facilities for reading and borrowing books, but also to be higher than that of the previous library. Houses and services vary according to the needs and wants of the users. The library functions as a place for research and social interaction. Due to the current state of technology, the library offers many new features, such as a Wi-Fi connection in the library. It comes with digital services in the library.

The library also offers discussion rooms and classrooms for other departments to conduct discussions and workshops. Today, libraries can include computer training rooms, professional counseling services, cafeterias and homework3. For example, Selangor Public Library Company offers its users its library and gym, cafes, 3D theaters and XD. You can list some other benefits of modern libraries:

- No physical restrictions
- Available anytime, anywhere
- Save the document
- Increase visibility in the library
- Assess the value of the content
- Use space Library as a training center

for art

As part of the library and socializing, people go to the library to find a park. In college libraries, students use the library as their second home. Many students spend time in the library. Depending on the public library, most users come from different backgrounds, ages, genders, and levels of education. Ahead Current research addresses the following

objectives

- Test the attitudes of high school students toward smart technology schools
- Compare learning styles for boys and girls

- Compare cutting-edge technology between public and private students
- Research on the availability of smart technologies to obtain resources among

Students happiness HO1

There is no significant difference between girls in high school and those in high school HO2: There is a big difference between high school girls and high school girls HO3: There is no significant difference in curriculum between public and private school students HO4: There is a big difference in the curriculum between public and private school students How to talk This survey was conducted using a search method. Example We conducted a survey of high school students in gadag to investigate the impact of library communications technology on their research. Students are considered true representatives and come from various high school classes and colleges. Library reading is only done in high school. A sample of 100 respondents was targeted. tool The term survey is very broad and can include questions used in telephone interviews, specifying criteria used in focus groups, and questions about ongoing survey respondents . The methods described in this work can be used to correct all of the above, but we focus on self-study, which is often referred to as cross-examination. The aim of most questionnaire questions s to develop a set of items that each respondent interprets in a way, answers correctly, and is ready

to be answered. Information translation This study analyzed a questionnaire to find out students 'and students' personal data about general technology. Tested using the T test. Girls and boys in modern technology. Percent, mean, medium, S.D. of the data collected. The value t is calculated manually. Discussion and interpretation The findings are presented and discussed in the following framework of research policy: Objective 1: To analyze the attitudes of high school students toward smart technology libraries

Table 1: Most of the students' attitudes towards the art library technology

Particulars	No of Students	Percentage
Total	100	100%
Highly Favorable	05	05
Above Favorable	40	40
Moderate Favorable	48	48
Below Favorable	07	07
Highly Unfavorable	00	00

The 21st century benefits business, industry, government, educational institutions and libraries. Libraries have upgraded their facilities and services to be more just accountants. It changes the context for how one or more activities affect the results and goals of the organization. This is a challenge for some organizations. Libraries as data and resource managers certainly need to keep up with current technological advances. Implementing digital systems in library resources is a current trend that libraries should consider, while users may want easy and easy access. With devices that are commonly used today, such as smartphones and laptops, you can access more information anytime and anywhere. Table 1 shows that only 5% of students liked it, 40% was good, 48% good, 7% bad, and 0% bad. The emergence of technology in the 21st century will also benefit business, industry, government, educational institutions and libraries. The absence of libraries has improved facilities and services. Changing the state situation regarding an activity or how it occurs impacts the results and goals of the organization. This is a relevant challenge for any organization. Libraries as a storage place for information and resources need to be in line with current technological advances . Implementing digital systems in library resources is a current trend that libraries should consider, while users may want easy and easy access. With devices that are commonly used today, such as smartphones and laptops, you can access mor information anytime and anywhere.

CONCLUSION

5% of students were very strong, 40% supported, 48% moderate, 7% negative and 0% negative. • The attitudes of students and women towards value technology have a T value of 2.39 which is lower than the standard table . value. With 4.18 degrees of freedom, it is 2.57 at the 0.05 level. Therefore, there are not many differences in attitudes between male and female students regarding professional skills. • Government funding. Students' highest gross profit on advanced technology was 4.60, which was higher than the grades classified at the critical level. For 3.89 degrees of freedom, it is 2.78 at the 0.05 level. Therefore, there is no big difference in the attitude of the government. Donor students go directly to the technical department. • Student technology is underdeveloped, under-distributed, and under-resourced. However, some smart technology resources such as libraries, the internet, e-mail, television, software (library software), and computer labs are considered complete. By not having the right fit, students
